# New Coffee Tree Discovered.

Three new species of coffee tree have been discovered in the Congo district by the French explorer, M. Chevalier. In a report to the State Department Consul General Guenther, at Frankfort, in discussing the new discovery, states that one of the species of these trees was of remarkable height and yielded very useful

fruit. It is called "coffee excelsa" and attains height of sixty-six feet, while other pecies reach the height of shrubs. It is a species reach the height of shrubs. It is a native of the forests adjacent to the eastern tributary of the Sahari.

It has also been found on the banks of the Bata, in the Ubangi basin. It grows at a high level above the sea and does not thrive in lower regions exposed to floods. The tree thrives best in a rich soil of nitrogen and soda, but lacking entirely in potash, phosphoric acid and lime.

The fruit consists of small grains, resembling in shape and size certain kinds of coffee in Abyssinia and Mocha. In its wild state the five-year-old tree is about twenty-seven feet high, yields about 1,200 beans, very rich in caffeine. The French government intends to make experiments in its Congo colony in the cultivation and improvement of this wild coffee tree.
